

# 15, 30, 50 Watt AC-DC (DC-DC) Converters Convert Simply

#### **Features**

- RoHS lead-free-solder and lead-solder-exempted products available
- Universal input range 100 240 VAC nominal
- · Additional DC input 90 250 VDC
- · Class I equipment
- Single output 5.1, 12, 24, or 48 VDC
- · Extremely compact design
- · Battery charger versions
- Operating ambient temperature range –10 to 50 °C with convection cooling
- · Short-circuit and no-load proof

Safety according to IEC/EN 60950-11, UL/CSA 60950-1, and UL 508  $^{\rm 2}$ 

<sup>1</sup> LOK

<sup>2</sup> LOS/LOR

# Description

The Convert Simply front-end converters represent a family of 15, 30, and 50 watt DIN-rail mountable AC-DC converters for use as rectifiers or battery chargers. Plastic casing, compact size, and high reliability make the LOS, LOR, LOK4000 Series an excellent choice for space-critical applications, where a DIN-Rail mountable AC-DC converter is required. The universal input range and a built-in input filter allow flexible operation in a wide variety of electronic equipment and enables worldwide connection to the mains.

The converters are available as rectifiers with 12 V, 24 V, or 48

V single output and as battery chargers for 12 V, 24 V, or 48 V batteries. The output voltage of LOK converters can be adjusted via the R input.

Safety approvals fully comply with worldwide requirements.

#### **Applications**

Typical applications are: powering building controls, factory automation, industrial controls, instrumentation, electromagnetic drives, fans, and other DC loads.

<sup>&</sup>lt;sup>1</sup> Linear derating to 85% of  $P_{0 \text{ nom}}$  below  $V_i$  = 105 VAC, 110 VDC

Models in yellow (or shaded) are not recommended for new designs.

# **Part Number Description**

<sup>&</sup>lt;sup>1</sup> Battery chargers and LOK4001-2RLD

Examples: LOK4140-2RLD: AC-DC converter, battery charger version, providing 12 - 15 V/3.6 A at the output LOK4601-2R: AC-DC converter, rectifier version, providing 24 V/2 A, 48 W at the output

<sup>&</sup>lt;sup>2</sup> LOK types only

 $<sup>^{3}</sup>$  Setting voltage  $V_{\text{o set}}$  for battery chargers with R-input left open-circuit.

<sup>&</sup>lt;sup>4</sup> For minimum order quantities and lead times contact Power-One.

<sup>&</sup>lt;sup>5</sup> Efficiency at  $V_{\text{i rated}}$  and  $I_{\text{o nom}}$ 

<sup>&</sup>lt;sup>2</sup> LOK models only

<sup>&</sup>lt;sup>3</sup> Up to 70 °C with derating

<sup>&</sup>lt;sup>4</sup> G is always placed at the end of the part number.

# **Functional Description**

The Convert Simply 15, 30, and 50 watt front-end modules are flyback converters with a fixed frequency of 100 kHz (LOK) or 130 kHz (LOR, LOS). The battery charger modules and the

LOK4001-2RLD have a rectangular *VII* output characteristic. The rectifier modules have overload protection working in a hiccup mode.

#### **Thermal Considerations**

If an AC-DC converter is located in free, quasi-stationary air (convection cooling) at the indicated maximum ambient temperature  $T_{\rm Amax}$  (see table:  $T_{\rm CMP}$  and is operated at its nominal input voltage and output power, the temperature measured at the  $T_{\rm CMP}$  will approach the indicated value  $T_{\rm CMP}$  after the warm-up phase. However, the relationship between  $T_{\rm AMP}$  and  $T_{\rm CMP}$  depends heavily on the conditions of operation and integration into a system. The thermal conditions are influenced by input voltage, output current, airflow, temperature of surrounding components and surfaces.  $T_{\rm AMP}$  is therefore, contrary to  $T_{\rm CMP}$ , an indicative value only.

The relation between the maximum allowed output power  $P_{\text{o allowed}}$  and the temperature  $T_{\text{A}}$  of the surrounding air is given in the figure below. The rates apply if the AC-DC converter is located in free, quasi-stationary air (convection cooling).

**Note:** Sufficient forced cooling allows  $T_{\rm A}$  to be higher than the value given in the table if  $T_{\rm C\ max}$  according to the table is not exceeded.

**Caution:** The installer must ensure that under all operating conditions  $T_C$  remains within the limits that are stated in the table *Temperature specifications*.

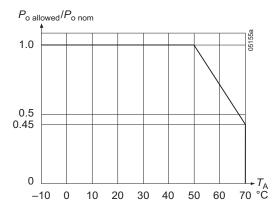

Fig. 4
Maximum allowed output power versus ambient temperature at  $V_i > 105$  VAC for LOK models, operated in vertical position

#### **Output Power at Low Input Voltage**

The output power of LOK models must be derated at low input voltage, see figure below.

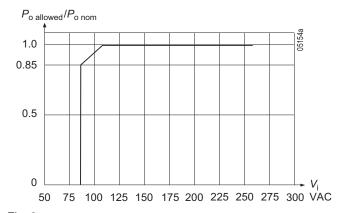

Fig. 3
Maximum allowed output power versus input voltage at  $T_A = 50$  °C for LOK models operated in vertical position

# **Output Protection**

Battery charger versions LOK4140-, 4240-, LOK4740-2RLD, and the LOK4001-2RLD have a rectangular current limitation characteristic, which limits the output current to within 100 and 150% of  $l_{0 \text{ nom}}$ . The other models are protected against overload by a current limiting circuit, which shuts down the converter in overload condition. It automatically restarts after removal of the overload condition (hiccup mode).

All models are short-circuit and no-load proof.

# **Outputs Connected in Series**

Two or more converters supplying the same or different output voltages may be connected in series. The value of the maximum output current to be taken is defined by that unit providing the lowest current limiting value. It should be assured that the outputs do not feed backwards into each other caused by their different rise/fall times at switch-on/off cycles by adding reverse polarity diodes across each output.

#### **Parallel Operation**

Only possible with battery charger versions.

The outputs of several battery charger models with equal output voltage (e.g. several LOK4240-2RLD) may be connected in parallel.

# **Auxiliary Functions**

# Adjustable Output Voltage (R input)

As a standard feature, the LOK units offer adjustable output voltage by using the control input R. If the R pin is left open-circuit, the output voltage is set to  $V_{0 \text{ nom.}}$  (see: *Output data*)

The R input is referenced to the secondary side of the converter. Adjustment of the output voltage is possible by means of either an external resistor or a voltage source.

a) Adjustment by means of an external resistor  $R_{\rm ext1}$ :

Depending upon the value of the required output voltage, the resistor shall be connected

**either:** Between the R terminal and Vo– to achieve an output voltage adjustment range of approximately

 $V_0 = 90 - 100 \% V_{0 \text{ nom}} \cdot (LOK4301, 4601 \text{ and } 4801 \text{ types})$ 

$$R_{\text{ext1}} \approx 4 \text{ k}\Omega \bullet \frac{V_{\text{o}}}{V_{\text{o nom}} - V_{\text{o}}}$$

or: Between the R terminal and Vo+ to achieve an output voltage range of approximately  $V_{\rm o}$  = 100 - 110%  $V_{\rm o \ nom}$  for rectifier versions and 100 - 125%  $V_{\rm o \ nom}$  for battery chargers.

$$R_{\text{ext2}} \approx 4 \text{ k}\Omega \cdot \frac{(V_0 - 2.5 \text{ V})}{2.5 \text{ V} \cdot (V_0 / V_{0 \text{ nom}} - 1)}$$

Table 4: Output Voltage OK signal

| b) Adjustment by means of an external voltage $V_{\rm ext}$ between |
|---|
| Vo- and R terminal to achieve an output voltage adjustment          |
| range of approx. 90 - 110% $V_{\rm o\ nom}$ (LOK 4301, 4601 and     |
| 4801 types), 93 - 117% $V_{\text{o nom}}$ for battery chargers.     |

$$V_{\text{ext}} \approx \frac{V_{\text{o}} \cdot 2.5 \text{ V}}{V_{\text{o nom}}}$$

Attempting to adjust the output below this range will cause the converter to shut down (hiccup mode).

**Note:** Applying an external control voltage >3 V may damage the converter.

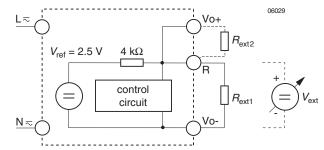

Fig. 5
Output voltage control by means of the R-input

# **Output Voltage OK (D Output)**

The D-output is referenced to Vo— and monitors the output voltage  $V_0$ . If  $V_0$  drops below  $V_0$ , the D-output will be disabled (open-collector circuit). The circuitry works independently of the input voltage and can therefore be used as battery-low indicator.

# **Battery Charging/Temperature Sensor**

The LOK 4140/4240/4740 are designed to charge lead-acid batteries. For optimum battery charging and extended life time of the battery an external temperature sensor may be connected to the R-input. The sensor should be mounted as close as possible to one of the poles of the battery.

Depending upon the cell voltage and the temperature coefficient of the battery, different temperature sensors are available. For more information please see: *Temperature Sensors* (Accessory Products on the Web Site) or contact Power-One.

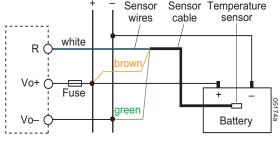

Fig. 6
Voltage setting by a temperature sensor, wiring diagram

If no sensor is used, the float charge voltage should be adjusted with a suitable resistor connected to the R input (see: *Adjustable Output Voltage*).

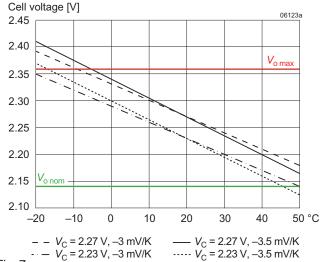

Fig. 7
Float charge voltage for defined temperature coefficients.

# **Electromagnetic Compatibility (EMC)**

# **Immunity**

A metal-oxide VDR together with the input fuse and the input filter form an effective protection against high input transient

voltages, which typically occur in most installations. The LOS, LOR, and LOK series have been successfully tested to the following specifications:

Table 5: Immunity type tests

#### **Terminal Allocation**

The terminal allocation table defines the electrical potentials of the AC-DC converters. For mechanical positions of the terminals see *Mechanical Data*.

Table 9: Terminal allocation

| Terminal | Electrical          | LOK/LOR/LOS |
|----------|---------------------|-------------|
| 1        | Input               | L≂          |
| 2        | Protective earth    | <b>(b)</b>  |
| 3        | Input               | N≂          |
| 4        | D/Output (positive) | D/+         |
| 5        | Output (positive)   | +           |
| 6        | Output (negative)   | _           |

| 8        | R input or open     | R/n.c.      |

#### **Standards and Approvals**

All LOK models are approved according to the standards IEC/EN 60950-1 and UL/CSA 60950-1.

LOR and LOS models are UL 508-listed components and approved to EN 60950:2000 and UL/CSA 60950-1.

These converters have been evaluated for:

- · Class I equipment.
- · Building in with vertical mounting on a DIN-rail.
- Double or reinforced insulation or an earthed part between input and output.
- · Basic insulation between input and earth
- · Functional insulation between output and earth
- · The use in a pollution degree 2 environment
- Connecting the input to a primary circuit with overvoltage category II.

The converters are subject to manufacturing surveillance in accordance with the above mentioned standards.

For details see the Declaration of Conformity (last 2 pages).

#### **Protection Degree**

IP 20: All models.

Table 10: Isolation

# Installation Instructions These converters are co

These converters are components, intended exclusively for inclusion within other equipment by an industrial assembly operation or by professional installers. Installation must strictly follow the national safety regulations in compliance with the enclosure, mounting, creepage, clearance, casualty, markings and segregation requirements of the end-use application.

Connection to the system shall be according to *Terminal allocation* and *Mechanical Data*. Check for hazardous voltages before altering any connection.

Ensure that a converter failure (e.g. by an internal short-circuit) does not result in a hazardous condition. See also *Safety of operator accessible output circuit*.

The phase input (L $\mathbb{R}$ ) is internally fused by a 1.6 A slowblow type. It is not customer-accessible. This fuse is designed to protect the unit in case of overcurrent. Option F or external fuses in the wiring to one or both input lines (L $\mathbb{R}$  and/or N $\mathbb{R}$ ) may therefore be necessary to ensure compliance with local requirements.

A second fuse in the wiring to the terminal N

is needed if:

- Local requirements demand an individual fuse in each source line
- · Neutral and earth impedance is high or undefined
- Phase and neutral of the mains are not defined or cannot be assigned to the corresponding termials (L

   to phase and N

   to neutral).

Note: Do not open the converters, or guarantee will be invalidated.

Make sure that there is sufficient air flow available for convection cooling. This should be verified by measuring the case temperature when the unit is installed and operated in the end-use application. The maximum specified case temperature  $T_{\text{C max}}$  shall not be exceeded.

**Note:** The converters are designed for vertical mounting on a DIN-rail. If a converter is operated as well in a horizontal position, the measuring point  $T_{\rm C}$  should be located on the top.

#### Isolation

The electric strength test is performed in the factory as routine test in accordance with EN 50116 and IEC/EN 60950 and should not be repeated in the field. Power-One will not honor any warranty claims resulting from electric strength field tests.

**Caution:** Testing by applying AC voltages will result in high and dangerous leakage currents flowing through the Y-capacitors (see fig. *Block diagram*).

| Characteristic                       |   | Input to protective earth | Input to output  | Output to protective earth | Unit |
|--------------------------------------|---|---------------------------|------------------|----------------------------|------|
| Electric<br>strength<br>test voltage | Actual factory test 1 s                           | 2.1                       | 2.1 <sup>1</sup> | 1.4                        | kVDC |
|                                      | AC test voltage equivalent to actual factory test | 1.5                       | 1.5 <sup>1</sup> | 1.0                        | kVAC |
| Insulation resistance at 500 VDC     |   | >300                      | >300             | >100                       | MΩ   |

<sup>&</sup>lt;sup>1</sup> In accordance with EN 50116 and IEC/EN 60950 only subassemblies are pre-tested with 4.3 kVDC or 3.0 kVAC.

# **Leakage Currents in AC-DC Operation**

Leakage currents flow due to internal leakage capacitance and RFI suppression Y-capacitors. The current values are proportional to the mains voltage and nearly proportional to the mains frequency and are specified at an input voltage of 264 V (50 Hz) where phase, neutral and protective earth are correctly connected as required for class I equipment.

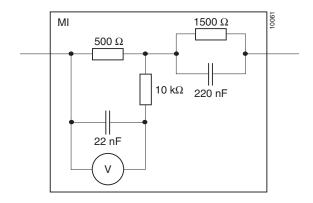

Fig. 11 Measuring instrument (MI) for earth leakage current tests according to IEC/EN 60950.

Under test conditions the leakage current flows through a measuring instrument (MI) as described in fig. *Measuring instrument for earth leakage current tests*, which takes into account impedance and sensitivity of a person touching accessible parts. The current value is calculated by dividing the measured voltage by 500 W. If inputs and/or outputs of LOS, LOR, or LOK models are connected in parallel, their individual leakage currents are added.

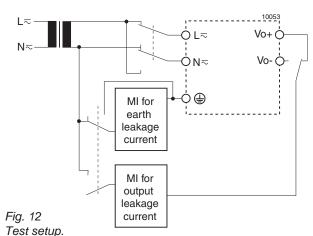

Table 11: Leakage currents

| Characteristic  | LOK                                   | Unit   |    |
|-----------------|---------------------------------------|--------|----|
| Maximum earth   | Permissible according to IEC/EN 60950 | 3.5 mA | mA |
| leakage current | Specified value at 264 V, 50 Hz       | 1.0    |    |
| Maximum output  | Permissible according to IEC/EN 60950 | 0.25   |    |
| leakage current | Specified value at 264 V, 50 Hz       | 0.035  |    |

# Safety of Operator-Accessible Output Circuit

If the output circuit of an AC-DC converter is operator accessible, it shall be a SELV circuit according to the IEC/EN 60950 related safety standards.

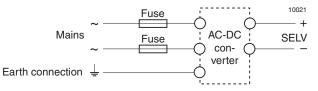

Fig. 13
Schematic safety concept.
Use fuses and earth connection as per Installation
Instructions and table Safety concept leading to a SELV output circuit.

The following table shows a possible installation configuration, compliance with which causes the output circuit of an LOS, LOR, or LOK4000 converter to be a SELV circuit according to IEC/EN 60950 up to a configured output voltage (sum of nominal voltages if in series or +/- configuration) of 36 V.

However, it is the sole responsibility of the installer to assure the compliance with the relevant and applicable safety regulations.

Table 12: Safety concept leading to a SELV output circuit

| Conditions             | AC-DC converter   | Installation   | Result   |
|------------------------|---|--|--|
| Nominal Supply voltage | Grade of insulation between input and output, provided by the AC-DC converter | Measures to achieve the resulting safety statuts of the output circuit               | Safety statuts of the AC-DC converter output circuit |
| Mains ≤250 VAC         | Double or reinforced  | Earth connection <sup>1</sup> and installation according to the applicable standards | SELV circuit   |

<sup>&</sup>lt;sup>1</sup> The earth connection of terminal no. 2 has to be provided by the installer according to the relevant safety standards, e.g. IEC/EN 60950

# **Description of Options**

#### **Option F: Built-in Second Fuse**

A built-in second fuse in the neutral input line enables safe connection to the mains where phase and neutral are not defined or cannot be identified as e.g., in the case of plug and socket connection to the mains via Schuko-plugs, see also *Installation Instruction*.

#### **Option K: System Connectors**

For installation into systems using preassembled harnesses the converters are available with connectors fitted with screw terminals. The system connectors are UL-listed and approved for currents up to 10 A. Wire cross-sections: Solid wires 1.5 mm² (AWG14), stranded wires 1 mm² (AWG16).

NUCLEAR AND MEDICAL APPLICATIONS - Power-One products are not designed, intended for use in, or authorized for use as critical components in life support systems, equipment used in hazardous environments, or nuclear control systems without the express written consent of the respective divisional president of Power-One, Inc.

TECHNICAL REVISIONS - The appearance of products, including safety agency certifications pictured on labels, may change depending on the date manufactured. Specifications are subject to change without notice.

# **EC Declaration of Conformity**

We

# Power-One AG Ackerstrasse 56, CH-8610 Uster

declare under our sole responsibility that all **LOS/LOR/LOK** series AC-DC (DC-DC) converters carrying the CE-mark are in conformity with the provisions of the Low Voltage Directive (LVD) 73/23/EEC of the European Communities.

Conformity with the directive is presumed by conformity wih the following harmonized standards:

- EN 61204: 1995 (= IEC 61204: 1993, modified)
   Low-voltage power supply devices, DC output Perfomance characteristics and safety requirements
- EN 60950: 2000 (= IEC 60950: 1999) for LOS/LOR models EN 60950-1: 2001 (= IEC 60950-1: 2001) for LOK models Safety of information technology equipment.

The installation instructions given in the corresponding data sheet describe correct installation leading to the presumption of conformity of the end product with the LVD. All these regulators are components intended exclusively for inclusion within other equipment by an industrial assembly operation or by professional installers. They must not be operated as stand alone products.

Hence conformity with the Electromagnetic Compatibility Directive 89/336/EEC (EMC Directive) needs not to be declared. Nevertheless, guidance is provided in most product application notes on how conformity of the end product with the indicated EMC standards under the responsibility of the installer can be achieved, from which conformity with the EMC directive can be presumed.
