**APPLICATION HINTS:**

For 14.5V supply and 8 Ω speaker application, its maximum power dissipation is about 1.8W.

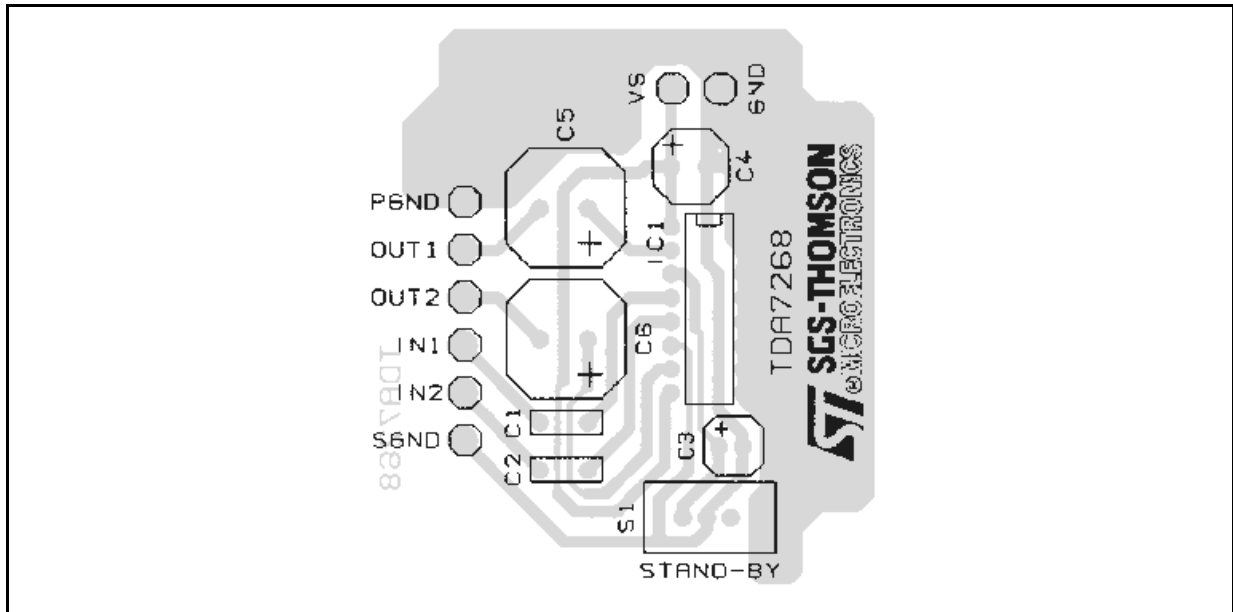

Assuming that max ambient temperature is 70 $^{\circ}C$, the required thermal resistance of the device mounted on the PCB with a dissipating area

must be equal to: $(150 - 70)/1.8 = 44.4^{\circ}C/W$.

Junction to pin thermal resistance of the package is about 15 $^{\circ}C/W$. That means external heat sink of about 30 $^{\circ}C/W$ is required.

Cu ground plane of PCB can be used as heat dissipating means.
