

**STK4162II** 

## AF Power Amplifier (Split Power Supply) (35W + 35W min, THD = 0.4%)

#### **Features**

- The STK4102II series (STK4162II) and STK4101V series (high-grade type) are pin-compatible in the output range of 6W to 50W and enable easy design.
- Small-sized package whose pin assignment is the same as that of the STK4101II series
- Built-in muting circuit to cut off various kinds of pop noise
- Greatly reduced heat sink due to substrate temperature 125°C guaranteed
- Excellent cost performance

### **Package Dimensions**

unit: mm

#### 4040

### **Specifications**

### **Maximum Ratings** at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage	V <sub>CC</sub> max		±45	V
Thermal resistance	Өј-с		2.1	°C/W
Junction Temperature	Tj		150	°C
Operating substrate temperature	Tc		125	°C
Storage temperature	Tstg		-30 to +125	°C
Available time for load short-circuit	ts	$V_{CC} = \pm 30V$ , $R_L = 8\Omega$ , $f = 50Hz$ , $Po = 35W$	2	S

#### **Recommended Operating Conditions** at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Recommended supply voltage	V <sub>CC</sub>		±30	V
Load resistance	R <sub>L</sub>		8	Ω

 $\label{eq:characteristics} \mbox{ at Ta} = 25^{\circ}C, \ V_{CC} = \pm 30V, \ R_L = 8\Omega, \ Rg = 600\Omega, \ VG = 40 dB, \\ \mbox{ } R_L : non\text{-inductive load}$ 

Parameter	Symbol	Conditions	min	typ	max	Unit
Quiescent current	Icco	V <sub>CC</sub> = ±36V	20	40	100	mA
Output power	Po (1)	THD = 0.4%, f = 20Hz to 20kHz	35			W
Output power	Po (2)	$V_{CC} = \pm 27V$ , THD = 1.0%, $R_L = 4\Omega$ , $f = 1$ kHz	40			W
Total harmonic distortion	THD	Po = 1.0W, f = 1kHz			0.3	%
Frequency response	f <sub>L</sub> , f <sub>H</sub>	Po = 1.0W, $^{+0}_{-3}$ dB		20 to 50k		Hz
Input impedance	r <sub>i</sub>	Po = 1.0W, f = 1kHz		55		kΩ
Output noise voltage	V <sub>NO</sub>	$V_{CC} = \pm 36V$ , $Rg = 10k\Omega$			1.2	mVrms
Neutral voltage	$V_N$	V <sub>CC</sub> = ±36V	-70	0	+70	mV
Muting voltage	V <sub>M</sub>		-2	-5	-10	V

Notes.

- For power supply at the time of test, use a constant-voltage power supply unless otherwise specified.
- For measurement of the available time for load short-circuit and output noise voltage, use the specified transformer power supply shown right.
- The output noise voltage is represented by the peak value on rms scale (VTVM) of average value indicating type. For AC power supply, use an AC stabilized power supply (50Hz) to eliminate the effect of flicker noise in AC primary line.

Specified Transformer Power Supply (Equivalent to RP-25)

### **Equivalent Circuit**

### Sample Application Circuit: 35W min 2-channel AF power amplifier

### Sample Printed Circuit Pattern for Application Circuit (Cu-foiled side)

# **Description of External Parts**

C1, C2 Input filter capacitors A filter formed with R3 or R4 can be used to reduce noise at high frequencies.  Input coupling capacitors Used to block DC current. When the reactance of the capacitor increases at low frequencies, the dependence of 1/fl noise on signal source resistance causes the output noise to worsen. It is better to decrease the reactance. To reduce the pop noise at the time of application of power, it is effective to increase C3, C4 that fix the time constant on the input side and to decrease C5, C6 on the NF side.  NF capacitors These capacitors fix the low cutoff frequency as shown below.  If L = 1/2 + C5 - R5 [Hz] To provide the desired violage gain at low frequencies. It is better to increase C5. However, do not increase C5 more than needed because the pop noise level becomes higher at the time of application of power.  C15 Deocupling capacitor Used to eliminate the ripide components that mix into the input side from the power line (+V <sub>CC</sub> ).  C11, C12 Bootstrap capacitors When the capacitor value is decreased, the distortion is liable to be higher at low frequencies.  C3, C10 C3, C10 C4 C4 C3, C3, C4 C5 C5 C7 C5 C8 C7 C9 C9 C11 C14 C9 C9 C9 C16 C15 C17 C9 C9 C9 C17 C9 C9 C9 C18 C16 C17 C9

### Sample Application Circuit (protection circuit and muting circuit)

### **Thermal Design**

The IC power dissipation of the STK4162II at the IC-operated mode is 46W max. at load resistance  $8\Omega$  and 81.0W max. at load resistance  $4\Omega$  (simultaneous drive of 2 channels) for continuous sine wave as shown in Figure 1 and 2.

Figure 1. STK4162II Pd – Po ( $R_L = 8\Omega$ )

Figure 2. STK4162II Pd – Po ( $R_L = 4\Omega$ )

In an actual application where a music signal is used, it is impractical to estimate the power dissipation based on the continuous signal as shown above, because too large a heat sink must be used. It is reasonable to estimate the power dissipation as 1/10 Po max. (EIAJ).

That is, Pd = 28.5W at  $8\Omega$ , Pd = 43.5W at  $4\Omega$ 

Thermal resistance  $\theta$ c-a of a heat sink for this IC power dissipation (Pd) is fixed under conditions 1 and 2 shown below.

Condition 1: 
$$Tc = Pd \times \theta c - a + Ta \le 125^{\circ}C$$
....(1)

where Ta: Specified ambient temperature

Tc: Operating substrate temperature

$$Condition \ 2: \ Tj = Pd \times (\theta c \text{-}a) + Pd/4 \times (\theta j \text{-}c) + Ta \leq 150^{\circ}C....(2)$$

where T<sub>j</sub>: Junction temperature of power transistor

Assuming that the power dissipation is shared equally among the four power transistors (2 channels  $\times$  2), thermal resistance  $\theta$ j-c is 2.1°C/W and

$$Pd \times (\theta c - a + 2.1/4) + Ta \le 150^{\circ}C$$
....(3)

Thermal resistance  $\theta$ c-a of a heat sink must satisfy inequalities (1) and (3).

Figure 3 shows the relation between Pd and  $\theta$ c-a given from (1) and (3) with Ta as a parameter.

[Example] The thermal resistance of a heat sink is obtained when the ambient temperature specified for a stereo amplifier is 50°C.

Assuming 
$$V_{CC} = \pm 30V$$
,  $R_L = 8\Omega$ ,

$$V_{CC} = \pm 27V$$
,  $R_L = 4\Omega$ ,

 $R_L = 8\Omega$  : Pd1 = 28.5W at 1/10 Po max.

$$R_L = 4\Omega : Pd2 = 43.5W \text{ at } 1/10 \text{ Po max.}$$

The thermal resistance of a heat sink is obtained from Figure 3.

$$R_{L} = 8\Omega : \theta c - a1 = 2.63^{\circ} C/W$$

$$R_{L} = 4\Omega : \theta c - a2 = 1.72^{\circ}C/W$$

Tj when a heat sink is used is obtained from

$$R_{L} = 8\Omega : Tj = 139.9^{\circ}C$$

$$R_{L} = 4\Omega : Tj = 147.7^{\circ}C$$

Figure 3. STK4162II θc-a – Pd
