

Germanium point-contact diodes

Germanium point-contact diodes GD 731, GD 732 and GD 733 are special-quality diodes with a high rectifying efficiency into the UHF region. These types are suitable for high resistance quality rectifying circuits, and are noted for their small spread in the quadratic region of the characteristic as well as the very small frequency dependence of their rectifying efficiency. With matching adapter (Q62901-B6) these diodes may be inserted into a cartridge fitting (type DIN 41861). The type number and diode symbol are stamped on the case. (Replacement for the former AAY 53, AAY 54, AAY 55.)
