### DESCRIPTION

The AIC431/TL431A/TL431 are 3-terminal adjustable precision shunt regulators with guaranteed temperature stability over the applicable extended commercial temperature range. The output voltage may be set at any level greater than 2.495V ( $V_{REF}$ ) up to 30V merely by selecting two external resistors that act as a voltage divider network. These devices have a typical output impedance of 0.08 $\Omega$ . Active output circuitry provides a very sharp turn-on characteristics, making these devices excellent improved replacements for zener diodes in many applications.

The precise  $\pm 0.5\%$  reference voltage tolerance of the AIC431 makes it possible in many applications to avoid the use of a variable resistor, consequently saving cost and eliminating drift and reliability problems associated with it.

## ELECTRICAL CHARACTERISTICS (Continued)

PARAMETER	TEST CONDITIONS	SYMBOL	MIN.	TYP.	MAX.	UNIT
Minimum Cathode current for Regulation	$V_Z = V_{REF}$ (Fig. 1)	$I_{Z(MIN)}$		0.25	0.5	mA
Off-State Current	$V_Z = 20V, V_{REF} = 0V$ (Fig. 3)	$I_{Z(OFF)}$		0.1	1.0	$\mu A$
Dynamic Output Impedance (Note 4)	$V_Z = V_{REF}$ Frequency = 0Hz (Fig. 1)	$R_Z$		0.08	0.3	$\Omega$

**Note 3.** Deviation of reference input voltage,  $V_{DEV}$ , is defined as the maximum variation of the reference input voltage over the full temperature range.

The average temperature coefficient of the reference input voltage,  $\alpha V_{REF}$  is defined as:

$$\Delta V_{REF} \frac{\text{ppm}}{^\circ\text{C}} = \frac{\pm \left[ \frac{V_{MAX} - V_{MIN}}{V_{REF}(\text{at } 25^\circ\text{C})} \right] 10^6}{T_2 - T_1} = \frac{\pm \left[ \frac{V_{DEV}}{V_{REF}(\text{at } 25^\circ\text{C})} \right] 10^6}{T_2 - T_1}$$

Where:

$T_2 - T_1$  = full temperature change.

$\alpha V_{REF}$  can be positive or negative depending on whether the slope is positive or negative.

Example:  $V_{DEV} = 9.0\text{mV}$ ,  $V_{REF} = 2495\text{mV}$ ,  
 $T_2 - T_1 = 70^\circ\text{C}$ , slope is negative.

$$\alpha V_{REF} = \frac{\left[ \frac{9.0\text{mV}}{2495\text{mV}} \right] 10^6}{70^\circ\text{C}} = -50\text{ppm}/^\circ\text{C}$$

**Note 4.** The dynamic output impedance,  $R_Z$ , is defined as:

$$R_Z = \frac{\Delta V_Z}{\Delta I_Z}$$

When the device is programmed with two external resistors,  $R_1$  and  $R_2$ , (see Fig. 2), the dynamic output impedance of the overall circuit, is defined as:

$$r_z = \frac{\Delta V_Z}{\Delta I_Z} \cong R_Z \left[ 1 + \frac{R_1}{R_2} \right]$$
